NEUROMEDICINE REPORT

MRN	: **IHL1037895**	Order No	: ID12609508359
Patient Name	: **M MOHSIN CHOWDHURY**	Exam No	: 260266931
Age/Gender	: 59Y 1M 29D / Male	Order Date	: 08/09/2026
Report No	: 1260000165140	Exam Date	: 09/09/2026 12:09 pm
Bed No	: 2-DB-33	Report Date	: 09/09/2026 12:09 pm
Ref. Doctor	: DR. DANIA RAHMAN	Report Status	: FINALIZED

Test Name : **EEG -BED SIDE**

Thank You Very Much For Kind Referral, Sir

The EEG recording was done under 10/20 digital multichannel system with sweep speed of 30 mm/sec & sensitivity of 7μV/mm. Both high & low gained filter were used and different montages were used to analyze the EEG. Video Telemetry was used throughout the test to monitor patient activity.

Background & Description of Findings:

Awake: Background rhythm was continuous and symmetrical in both frequency and amplitude. Predominant frequencies were Beta & Alpha arranged in a well maintained anterior-posterior gradient. Posterior dynamic rhythm was noted to have frequency of 10 Hz with amplitude of 30-80μV which was rhythmic and attenuated by eye opening. Myogenic artifacts and blink artifacts were seen.

Asleep: Patient was awake throughout the recording

Photic stimulation did not elicit any abnormal photic driving response. There was no photoparoxysmal response.

Hyperventilation did not elicit any abnormality.

EKG showed sinus rhythm with HR 90-96 beat/min.

Comments & Impression:

Normal awake EEG, there is no feature of inter-ictal epileptiform discharges, or any focal slowing to implicate cortical disturbance or seizure focus. There was excessive beta activity in bilateral frontal regions which is indicative of *anxiety state*. Clinical correlation is recommended.
